Providing a Safe CTE Learning Environment: Fact or Fiction?

Mark Threeton – Assistant Professor, Pennsylvania State University

Accidents within the learning environment result from a chain of sequential events, which are metaphorically similar to a line of falling dominoes. As one domino falls it triggers the next and so on. Come learn about recent research findings, which identified common deficiencies associated with health and safety in career and technical education (CTE) programs. Participants will learn to use data to remove factors such as unsafe conditions and acts within CTE programs to prevent this harmful chain reaction.
